COVER LETTER REGARDING EXECUTED APPLICATION

Commissioner of Patents and Trademarks
Washington, D.C. 20231

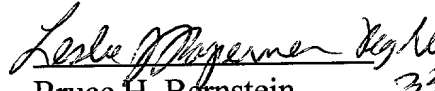

Sir:

The undersigned points out that the executed application being filed herewith includes pages 1 - 3 of the executed declaration which were forwarded to the undersigned, and pages 1 - 28 of the specification (with Figure 1) which were provided by the law firm of the undersigned. It is noted that the pages submitted by the law firm of the undersigned are identical to those sent to the assignee of the present application. Further, the application was not revised after review.

Accordingly, Applicants respectfully submit that the present application is properly executed and should be considered as filed in executed form. However, if the U.S. Patent and Trademark Office determines that the present application is not properly executed, Applicants respectfully request that the present application be treated as an unexecuted application under 37 C.F.R. 1.53(f).

Should there be any questions regarding this paper, please contact the undersigned at the below listed number.

Respectfully submitted,
Robert R. BUSHEY et al.

TITLE OF INVENTION:

**A METHOD TO IDENTIFY AND CATEGORIZE CUSTOMER'S GOALS AND
BEHAVIORS WITHIN A CUSTOMER SERVICE CENTER ENVIRONMENT**

CROSS-REFERENCE TO RELATED APPLICATIONS

The present application claims the benefit of U.S. Provisional Application No. 60/136,405, filed May 27, 1999, the subject matter of which is herein expressly incorporated by reference.

The present invention relates to a method described in commonly-assigned co-pending U.S. Patent Application No. 09/089,403, "A Method for Categorizing, Describing, and Modeling Types of System Users", filed June 3, 1998, to R. Bushey et al. and to a method described in commonly-assigned co-pending U.S. Patent Application No. 09/303,622, "Methods for Intelligent Routing of Customer Requests Using Customer and Agent Models", filed May 3, 1999, to R. Bushey et al., the subject matter of both of which is expressly incorporated by reference herein in their entirety.

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to the identification and categorization of customer's goals when contacting a customer service center. In particular the present invention

relates to the field of integrating customer behavioral models with the handling of customer requests.

2. Description of Background Information

5 The common knowledge and practice in the industry is to allow customers to map their goal to an organizational unit and, thus, determine which service center would best handle their goal. The customer typically does this with center information provided from the telephone directory or the bill. For example, some of the center information provided in the telephone directory include "to order or move your home telephone service", "for questions about your bill", and "residence repair". After the customer has contacted the center they believe is most appropriate to accomplish their goal, the customer typically has to use an IVR (Interactive Voice Response) system or a similar system to accomplish his/her intended goal. Based on the choice of the intended goal, a system is used to direct the customer to the appropriate center. The customer and the agent determine if the customer's goal can be appropriately handled at that center or if the customer needs to be transferred to another, more appropriate location.

20 Currently, customers use the telephone to present their goals. When the customer makes a call, some call centers may split off incoming customer calls to a dedicated agent group when the customer has a specific language preference. Some call centers also split off customer calls that originate from residences separate from customer calls that originate from businesses. In addition, some call centers split customer calls where the

P19115.S01

customer wishes to place an order for a service separate from the customer calls where the customer wishes additional information on their bill or similar information.

Whether a call center performs any preliminary routing or not, none of the call centers route customer calls to agents with a conditional probability. They also do not categorize the customers' behaviors and model those categorized behaviors. In addition, many service centers now handle customer requests through the telephone, while future technology will allow customers to accomplish their goals through a variety of channels beyond the telephone.

The ideal customer handling system is designed with full and complete knowledge of functionality, technology, and customer requirements. While functionality and technology issues are represented well, a full, rich understanding of the customers and their goal statements are not well understood. In fact, the common assumption is that the customer's comments are similarly stated and, thus, a single view of the customer population can be taken. This single view approach limits the performance of an implemented customer service system because not all of the customer comments are similarly stated, and thus handled appropriately. Therefore, the implemented system may function well for certain customers, while being inappropriate for other customers. When overall performance is critical, these mishandled customer contacts can cost organizations time and money.

An improved approach to this situation is to not take a single view of the customers, but rather to examine the customers' comments and the verbal styles in which

the comments are presented. The comments represent the goal of the customer and can be attained through a predicate analysis.

BRIEF DESCRIPTION OF THE DRAWINGS

5 Figure 1 illustrates a flowchart of the Customer Goal and Behavior Categorization Method, according to an aspect of the present invention.

DETAILED DESCRIPTION OF THE INVENTION

10 The present invention contributes to the identification and categorization of customer's goals, when contacting a customer service center. This invention also integrates customer behavioral models with the handling of customer requests. None of the prior art contains customer goal identification and customer behavioral models.

15 U.S. Patent Application No. 09/089,403, filed June 3, 1998, entitled "A Method for Categorizing, Describing, and Modeling Types of System Users" (referred to as "CDM") focuses on the categorization, describing and modeling of agents and customers. The method of the present invention incorporates some aspects of the CDM patent into the categorization of the customers. However, the present method also facilitates the determination of the customer's goal through predicate analyses and conditional probabilities.

20 The method of the present invention differs from provisional U.S. Patent Application No.60/097,174, filed on August 20, 1998 entitled "A Method for Intelligent

Call Routing Utilizing A Performance Optimizing Calculation Integrating Customer and Agent Behavioral Models" in that the disclosed method is not a call routing method. The present method focuses on the reason a customer contacts a service center, i.e. their goal, and integrates this information into a complete view of the customer. The present method takes a broader view of customer channels by considering more than just the telephone.

A primary contribution of this invention is the conditional probability calculation to assign the appropriate goal category to the customer's request. No prior art contains a conditional probability calculation used to categorize the customer's request.

According to an aspect of the present invention, the method for identifying and categorizing customer goals for contacting a service center is provided which includes receiving a customer request; performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior and a goal for the customer; and assigning the customer request to a service center associated with the identified one of customer behavior and customer goal. The method includes categorizing the customer behavior into one of a plurality of groups, and matching a result of the verbal style analysis to an appropriate model with the categorized group.

According to another aspect of the present invention, the method may also include performing a predicate analysis which includes calculating conditional probabilities that relate the customer request to customer goal categories; comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; and mapping the customer request to a customer goal category related

P19115.S01

to the maximum conditional probability if the maximum conditional probability is equal to or greater than the minimal set value.

In another aspect of the present invention, the predicate analysis of the method may include calculating conditional probabilities that relate the customer request to customer goal categories; comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; asking a clarifying question if the maximum conditional probability is less than the maximum conditional probability; and subsequently performing the predicate analysis on the customer's request based on the answer to the clarifying question.

According to a further aspect of the present invention, the predicate analysis may include calculating conditional probabilities that relate the customer request to customer goal categories; comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; and mapping the customer request to a customer goal category related to the maximum conditional probability if the maximum conditional probability is equal to or greater than the minimal set value.

In another aspect of the present invention, the predicate analysis may be performed by asking a clarifying question if the maximum conditional probability is less than the maximum conditional probability; and subsequently performing the predicate analysis on the customer's request based on the answer to the clarifying question.

According to a still further aspect of the present invention, a method is provided for identifying and categorizing customer goals for contacting a service center, wherein

the method includes: receiving a customer request; performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify a customer behavior and a goal for the customer; categorizing the customer behavior into one of a plurality of behavioral groups; matching a result of the verbal style analysis to an appropriate behavioral group model; calculating conditional probabilities that relate the customer's request to respective customer goal categories; comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; mapping the customer request to a customer goal category; and assigning the customer request to a service center associated with a respective one of the behavioral group model and the mapped customer goal category.

Further aspects of the invention include mapping the customer's goal to a respective goal category if the conditional probability for the customer's goal is equal to or greater than a minimal set value, and asking the customer a clarifying question if the conditional probability for the customer's goal is equal to or greater than the minimum set value for goal categories related to more than one location.

According to other aspects of the present invention, if the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer, and if a clarifying question is asked to the customer based on the customer's answer, a new predicate analysis is performed and new conditional probabilities for the customer's goal are calculated by comparing the maximum conditional probability against the minimum confidence goal value.

Further aspects of the present invention include expressing the receiving customer request through an interactive voice response system; expressing the receiving customer request through a question typed on a computer via an Internet connection; and expressing the receiving customer request through a question directly to a human operator via telephone.

According to another aspect of the present invention, the method may include performing verbal style analysis with respect to number of words used, types of words used, duration of comment, and method of contact. Also, the present invention includes performing predicate analysis on the customer's request to identify a customer behavior for the customer is based upon key words used by said customer, specific types of words the customer uses, and language components.

According to a further aspect of the present invention, the method may also include categorizing the customer behavior into one of a plurality of groups includes at least one of the groups comprising similar behaviors and at least one of the groups comprising different behaviors between the plurality of groups, and calculating conditional probabilities that relate the customer request to customer goal categories comprises a score that indicates how well said customer goal is matched to the respective goal category.

According to a still further aspect of the invention, a method is provided which includes: receiving a customer request; performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior

and a goal for the customer; the performing verbal style analysis includes analysis with respect to number of words used, types of words used, duration of comment, and method of contact, and performing predicate analysis on the customer's request to identify a customer behavior for the customer is based upon key words used by the customer, specific types of words the customer uses, and language components.

The method may further include categorizing the customer behavior into one of a plurality of behavioral groups, wherein categorizing the customer behavior into one of a plurality of groups may include at least one of the groups having similar behaviors and at least one of said groups having different behaviors between the plurality of groups. Thereafter, a result of the verbal style analysis is matched to an appropriate behavioral group model, conditional probabilities that relate the customer's request to respective customer goal categories are calculated, and wherein the conditional probability is a score that indicates how well the customer goal is matched to respective said goal category.

The method may further include comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value and mapping the customer request to a customer goal category, wherein if the conditional probability for the customer's goal is equal to or greater than a minimal set value, the customer's goal is mapped to a respective the goal category. If the conditional probability for the customer's goal is equal to or greater than the minimum set value for goal categories related to more than one location, a clarifying question is asked to the

customer, if the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer, and if a clarifying question is asked to the customer based on the customer's answer, a new predicate analysis is performed and new conditional probabilities for the customer's goal are calculated by comparing the maximum conditional probability against the minimum confidence goal value, and the customer request is assigned to a service center associated with the mapped customer goal category.

According to another aspect of the present invention, a computer program is provided for identifying and categorizing customer goals for contacting a service center stored on a computer readable medium wherein the program may include codes for receiving a customer request, performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior and a goal for the customer, categorizing the customer behavior into one of a plurality of groups, and matching a result of the verbal style analysis to an appropriate model with the categorized group.

The program may further include calculating conditional probabilities that relate the customer request to customer goal categories, comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value. If the conditional probability for the customer's goal is equal to or greater than a minimal set value, the customer's goal is mapped to a respective said goal category, if the conditional probability for the customer's goal is equal to or greater than the minimum set

P19115.S01

value for goal categories related to more than one location, a clarifying question is asked to the customer, if the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer, and the customer request is assigned to a service center associated with the identified one of customer behavior and customer goal.

An objective of the present invention is to establish a method that identifies and categorizes a customer's goal and the customer's verbal style used to present that goal. The method then determines the conditional probability in which that particular goal matches a given goal category. Based on that conditional probability, the customer's goal is then assigned to the appropriate goal category. If the conditional probability does not meet the minimum confidence goal value, a clarifying question is used to better determine the customer's goal. The conditional probability is then recalculated and compared to the minimum confidence goal value. The method also categorizes the customer into a behavior-based grouping, matches the customer's behavior to the appropriate customer model, and assigns that information to the same category determined from the conditional probability. The implemented customer goal and the behavior handling system will have a higher level of performance compared to systems that do not incorporate this method.

The present invention uses a predicate analysis on the customer comments. Based on the predicate analysis, conditional probabilities are determined for the customer comments as related to each of the possible goal categories. The goal category that

results in the maximum conditional probability is then examined against the minimum confidence goal value. The minimum confidence goal value represents the lowest number in which the confidence of the goal category is at an acceptable level. If the maximum conditional probability is less than the minimum confidence goal value, a clarifying question is used to better determine the customer's goal. The conditional probabilities are recalculated and if the maximum conditional probability is greater than the minimum confidence goal value, the customer/comments are considered to be identified and, thus, can be handled appropriately and at the appropriate center. If the maximum conditional probability is less than the minimum confidence goal value, another clarifying question is used to better determine the customer's goal. If the maximum conditional probability is still less than the minimum confidence goal value after a set of clarifying questions, the customer/comments are considered to be unknown and will be handled appropriately.

The customer comments also offer behavioral aspects of the customer through the verbal style used by the customer. For example, loquacious customers who describe a story rather than stating just the goal have a different behavior than customers whom clearly and succinctly state the goal. Thus, a verbal style analysis is used to facilitate the behavioral categorization of the customers. It could include analysis on the number of words used in the comments, the duration of the comments, key words used, etc.

Additional analysis could also be examined, for example, the type of contact method used by the customer (i.e., talking on the telephone, typing on a computer and using the

Internet, talking in person, etc.). These are important factors in determining how to behaviorally categorize the customer.

Figure 1 illustrates the customer behavior information and goal modeling method. The customer first expresses the goal (or problem) they are trying to achieve or complete, which is identified at S1 as a "customer request". The customer may express the goal through any appropriate medium, for example, an IVR system, a question on the Internet, directly to a human operator, or through some other channel or format.

Two types of analyses are then performed on the customer's comments, namely, verbal style analyses as indicated at S2 and predicate analyses as indicated at S3. The verbal style analyses would include, for example, the number of words used, types of words used, duration of comment, etc. In addition, these analyses would also include the method of contact (i.e., talking on the telephone, typing on a computer and using the Internet, talking in person, etc.).

After the verbal style analyses are performed, the customer's behavior is then categorized into one of a limited number of groups as indicated at S4. Next, the customer is matched to the appropriate behavioral model of the categorized group as indicated at S5. The customer's analyses and the corresponding model are then handled with the customer/comments to the final location as indicated at S6.

In the other flow shown in Figure 1, a predicate analysis is performed on the customer's comments as indicated at S3. This analysis would be based on a variety of analyses including, for example, the key words the customer uses, the specific types (e.g.,

P19115.S01

verb, object, etc.) of words the customer uses, the language components, etc. The predicate analysis is expected to facilitate the determination of the customer's goal. The predicate analysis can also facilitate the categorization of the customer into a behavioral group because the content of the customer comments may be specific to a particular group as indicated at S4.

Next, a conditional probability is determined for the customer goal as it relates to the goal categories as indicated at S7. The conditional probability is a score that indicates how well that particular customer goal is matched to a particular goal category. If the conditional probability for the customer's goal is equal to or greater than some minimal set value at S8, then the customer's goal is mapped to that goal category as indicated at S10. If the conditional probability for the customer's goal is equal to or greater than the minimum set value for goal categories related to more than one location at S8, a clarifying question is asked to the customer as indicated at S9. If the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer.

If a clarifying question is asked to the customer at S9, based on the customer's answer, a new predicate analysis is performed at S3 and new conditional probabilities for the customer's goal are calculated. The maximum conditional probability will be examined against the minimum confidence goal value at S8.

After the customer's goal has been mapped to the appropriate goal category, the customer/comments are then handled at the location associated with the appropriate goal category.

Accordingly, the advantages of the present invention are primarily focused on improved operating performance. This means that the method of the present invention will allow the customer's goals to be better understood and, thus, a customer service center will be better able to accomplish those goals. This more efficient goal accomplishment benefits both the customer and the user of the present invention. Also, additional customer information and characteristics will be gained.

The current practice is to allow the customers to determine the best center to contact. This invention allows the customer to be handled based on the goals of the customer so that the match between customer goals and the center to accomplish those goals are optimized. The overall performance of the centers will improve with this goal identification method because each of the customer requests will be handled by the most appropriate center. Another advantage of the method of the present invention will be that the customers will have a higher level of satisfaction with the treatment and handling of their request because the agent/section will be better suited for their particular goal.

A summary of benefits to the user of the disclosed invention are listed below: (1) revenue generated per customer call should increase (fewer misdirects); (2) agents can out-perform other similar agents at other organizations; (3) other organizations would still be attempting to force all of their agents into determining the goals of the customer and

then deciding if those goals could be appropriately handled in the location; (4) the present invention provides an important tool for obtaining and retaining customers; and (5) the present invention is a method which customers are expected to appreciate; it gives customers a reason to enhance their opinion of the user of the invention as a company that adjusts to their needs and capabilities; thus, the user of the invention becomes the carrier of choice.

Although the invention has been described with reference to several embodiments, it is understood that the words that have been used are words of description and illustration, rather than words of limitation. The method disclosed can be used to identify and categorize the reason a customer contacts a customer service center on a variety of systems, including but not limited to interactive voice response systems, information input into a computer system via the Internet, computer systems, and any other system which a service center may use.

While the invention has been described with reference to a preferred embodiment, it is understood that the words which have been used herein are words of description and illustration, rather than words of limitations. Changes may be made, without departing from the scope and spirit of the invention in its aspects. Although the invention has been described herein with reference to methods and means, the invention is not intended to be limited to the particulars disclosed herein; rather, the invention extends to all functionally equivalent methods and uses.

WHAT IS CLAIMED:

1. A method for identifying and categorizing customer goals for contacting a service center comprising:

receiving a customer request;

5 performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior and a goal for the customer; and

assigning the customer request to a service center associated with the identified one of customer behavior and customer goal.

2. The method according to claim 1, wherein said verbal style analysis comprises categorizing the customer behavior into one of a plurality of groups, and matching a result of the verbal style analysis to an appropriate model with the categorized group.

3. The method according to claim 1, wherein said predicate analysis comprises calculating conditional probabilities that relate the customer request to customer goal categories;

comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; and

mapping the customer request to a customer goal category related to the maximum conditional probability if the maximum conditional probability is equal to or greater than the minimal set value.

- 5
4. The method according to claim 1, wherein said predicate analysis comprises calculating conditional probabilities that relate the customer request to customer goal categories;
- comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value;
- asking a clarifying question if the maximum conditional probability is less than the maximum conditional probability; and
- subsequently performing the predicate analysis on the customer's request based on the answer to the clarifying question.
5. The method according to claim 2, wherein said predicate analysis comprises calculating conditional probabilities that relate the customer request to customer goal categories;
- comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; and

mapping the customer request to a customer goal category related to the maximum conditional probability if the maximum conditional probability is equal to or greater than the minimal set value.

5

6. The method according to claim 5, wherein said predicate analysis comprises asking a clarifying question if the maximum conditional probability is less than the maximum conditional probability; and subsequently performing the predicate analysis on the customer's request based on the answer to the clarifying question.

7. A method for identifying and categorizing customer goals for contacting a service center, the method comprising:

receiving a customer request;

performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify a customer behavior and a goal for the customer;

categorizing the customer behavior into one of a plurality of behavioral groups;

matching a result of the verbal style analysis to an appropriate behavioral group model;

calculating conditional probabilities that relate the customer's request to

20

respective customer goal categories;

P19115.S01

comparing a maximum conditional probability obtained from the calculated
conditional probabilities with a minimal set value;
mapping the customer request to a customer goal category; and
assigning the customer request to a service center associated with a respective one
5 of the behavioral group model and the mapped customer goal category.

8. The method according to claim 7, wherein if the conditional probability for the
customer's goal is equal to or greater than a minimal set value, the customer's goal is
mapped to a respective said goal category.

9. The method according to claim 7, wherein if the conditional probability for the
customer's goal is equal to or greater than the minimum set value for goal categories
related to more than one location, a clarifying question is asked to the customer.

10. The method according to claim 7, wherein if the conditional probability for the
customer's goal is less than the minimum set value for the goal categories, a clarifying
question is asked to the customer.

11. The method according to claim 7, wherein if a clarifying question is asked to said
20 customer based on the customer's answer, a new predicate analysis is performed and new

P19115.S01

conditional probabilities for the customer's goal are calculated by comparing the maximum conditional probability against the minimum confidence goal value.

12. The method according claim 7, the method further comprising:

5 expressing the received customer request through an interactive voice response system.

13. The method according claim 7, the method further comprising:

10 expressing the received customer request through a question typed on a computer via an Internet connection.

14. The method according claim 7, the method further comprising:

15 expressing the received customer request is through a question directly to a human operator via telephone.

15. The method according claim 7, wherein performing verbal style analysis includes analysis with respect to number of words used, types of words used, duration of comment, and method of contact.

20 16. The method according claim 7, wherein performing predicate analysis on the customer's request to identify a customer behavior for the customer is based upon key

P19115.S01

words used by said customer, specific types of words said customer uses, and language components.

17. The method according claim 7, wherein categorizing the customer behavior into one of a plurality of groups includes at least one of said groups comprising similar behaviors and at least one of said groups comprising different behaviors between said plurality of groups.

18. The method according claim 7, the wherein calculating conditional probabilities that relate the customer request to customer goal categories comprises a score that indicates how well said customer goal is matched to said respective goal category.

19. A method for identifying and categorizing customer goals for contacting a service center, the method comprising:

receiving a customer request;

performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior and a goal for the customer;

said performing verbal style analysis includes analysis with respect to number of words used, types of words used, duration of comment, and method of contact; and

said performing predicate analysis on the customer's request to identify a customer behavior for the customer is based upon key words used by the customer, specific types of words the customer uses, and language components; categorizing the customer behavior into one of a plurality of behavioral groups;

5

said categorizing the customer behavior into one of a plurality of groups includes at least one of said groups comprising similar behaviors and at least one of said groups comprising different behaviors between said plurality of groups; matching a result of the verbal style analysis to an appropriate behavioral group model;

calculating conditional probabilities that relate the customer's request to respective customer goal categories;

wherein said conditional probability is a score that indicates how well said customer goal is matched to respective said goal category; comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value; mapping the customer request to a customer goal category;

wherein if the conditional probability for the customer's goal is equal to or greater than a minimal set value, the customer's goal is mapped to a respective said goal category;

wherein if the conditional probability for the customer's goal is equal to or greater than the minimum set value for goal categories related to more than one location, a clarifying question is asked to the customer;

wherein if the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer;

wherein if a clarifying question is asked to the customer based on the customer's answer, a new predicate analysis is performed and new conditional probabilities for the customer's goal are calculated by comparing the maximum conditional probability against the minimum confidence goal value; and assigning the customer request to a service center associated with the mapped customer goal category.

20. The method according claim 19, wherein the received customer request is expressed through an interactive voice response system.

21. The method according claim 19, wherein the received customer request is expressed through a question typed on a computer via an Internet connection.

22. The method according claim 19, wherein the received customer request is expressed through a question directly to a human operator via telephone.

23. A method for identifying and categorizing customer goals for contacting a service center comprising:

receiving a customer request;

performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior and a goal for the customer;

categorizing the customer behavior into one of a plurality of groups; and

matching a result of the verbal style analysis to an appropriate model with the categorized group;

calculating conditional probabilities that relate the customer request to customer goal categories;

comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value;

wherein if the conditional probability for the customer's goal is equal to or greater than a minimal set value, the customer's goal is mapped to a respective said goal category;

wherein if the conditional probability for the customer's goal is equal to or greater than the minimum set value for goal categories related to more than one location, a clarifying question is asked to the customer;

wherein if the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer; and

assigning the customer request to a service center associated with the identified one of customer behavior and customer goal.

24. A computer program for identifying and categorizing customer goals for contacting a service center stored on a computer readable medium, comprising:

receiving a customer request;

performing at least one of a verbal style analysis and a predicate analysis on the customer's request to identify one of a customer behavior and a goal for the customer;

categorizing the customer behavior into one of a plurality of groups; and

matching a result of the verbal style analysis to an appropriate model with the categorized group;

calculating conditional probabilities that relate the customer request to customer goal categories;

comparing a maximum conditional probability obtained from the calculated conditional probabilities with a minimal set value;

wherein if the conditional probability for the customer's goal is equal to or greater than a minimal set value, the customer's goal is mapped to a respective said goal category;

wherein if the conditional probability for the customer's goal is equal to or greater than the minimum set value for goal categories related to more than one

location, a clarifying question is asked to the customer;

P19115.S01

wherein if the conditional probability for the customer's goal is less than the minimum set value for the goal categories, a clarifying question is asked to the customer; and

assigning the customer request to a service center associated with the identified

ABSTRACT OF THE INVENTION

A method is provided that identifies and categorizes the reason a customer contacts a customer service center, i.e. the customer's goal or problem. In addition, the method allows the customer to be categorized into a set of behavior-based groupings.

5

This integration of goal and customer categorization establishes the foundation to optimally direct the customer's request through an appropriate center. This method can collect information regarding the customer's behavior and can use that behavioral information to determine the optimal manner for handling the customer request.

```

graph TD
    S1[Customer request] --> S2[Perform "Verbal Style Analysis"  
(# words, duration, etc.)]
    S1 --> S3[Perform "Predicate Analysis"]
    S2 --> S4[Categorize customer's behaviors]
    S3 --> S7[Calculate "conditional probabilities" to  
relate customer's request to customer's goal]
    S7 --> S4
    S7 --> S8{Is "max. conditional probability" greater than min.  
confidence goal value?}
    S8 -- No --> S9[Ask clarifying question]
    S8 -- Yes --> S10[Assign to goal category]
    S4 --> S5[Match the results of the "verbal style analyses" to the appropriate  
behavioral group model]
    S5 --> S6[Knowledge of the customer's goal and behaviors in order to  
optimally handle the customer request]
    S10 --> S6
    S9 --> S3

Declaration and Power of Attorney For Utility or Design Patent Application

English Language Declaration

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

A METHOD TO IDENTIFY AND CATEGORIZE CUSTOMER'S GOALS AND BEHAVIORS WITHIN A CUSTOMER SERVICE CENTER ENVIRONMENT

the specification of which is attached hereto unless the following box is checked:

☐ was filed on _____ as

United States Application Number _____
and was amended on _____ (if applicable) or,

PCT International Application Number _____
and was amended on _____ (if applicable)

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code §119 (a-d) or §365(b) of any foreign application(s) for patent or inventor's certificate, or §365(a) of any PCT international application which designated at least one country other than the United States of America, listed below. I have also identified below, by checking the "No" box, any foreign application for patent or inventor's certificate, or of any PCT international application having a filing date before that of the application on which priority is claimed:

(Number)	(Country)	(Day/Month/Year Filed)	Priority Claimed	
_____	_____	_____	<input type="checkbox"/> Yes	<input type="checkbox"/> No
_____	_____	_____	<input type="checkbox"/> Yes	<input type="checkbox"/> No
_____	_____	_____	<input type="checkbox"/> Yes	<input type="checkbox"/> No

☐ Additional foreign application numbers are listed on a supplemental priority sheet attached hereto.

I hereby claim the benefit under Title 35, United States Code §119(e) of any United States provisional application(s) listed below.

60/136,405 (Number)	27 May 1999 (Day/Month/Year Filed)
_____	_____
_____	_____

☐ Additional provisional application numbers are listed on a supplemental priority sheet attached hereto.

I hereby claim the benefit under Title 35, United States Code §120 of any United States application(s), or §365(c) of any PCT international application designating the United States of America, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States or PCT international application in the manner provided by the first paragraph of Title 35, United States Code §112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations §1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application.

(Application No.)

(Filing Date)

(patented, pending, abandoned)

☐ Additional U.S. or international application numbers are listed on a supplemental priority sheet attached hereto.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

The undersigned hereby authorizes the U.S. attorney or agent named herein to accept and follow instructions from either his foreign patent agent or corporate representative, if any, as to any action to be taken in the Patent and Trademark Office regarding this application without direct communication between the U.S. attorney or agent and the undersigned. In the event of a change in the persons from whom instructions may be taken, the U.S. attorney or agent named herein will be so notified by the undersigned.

POWER OF ATTORNEY: As a named inventor, I hereby appoint the attorney(s) and/or agent(s) associated with the Customer Number provided below to prosecute this application and transact all business in the Patent and Trademark Office connected therewith, and direct that all correspondence be addressed to that Customer Number:
